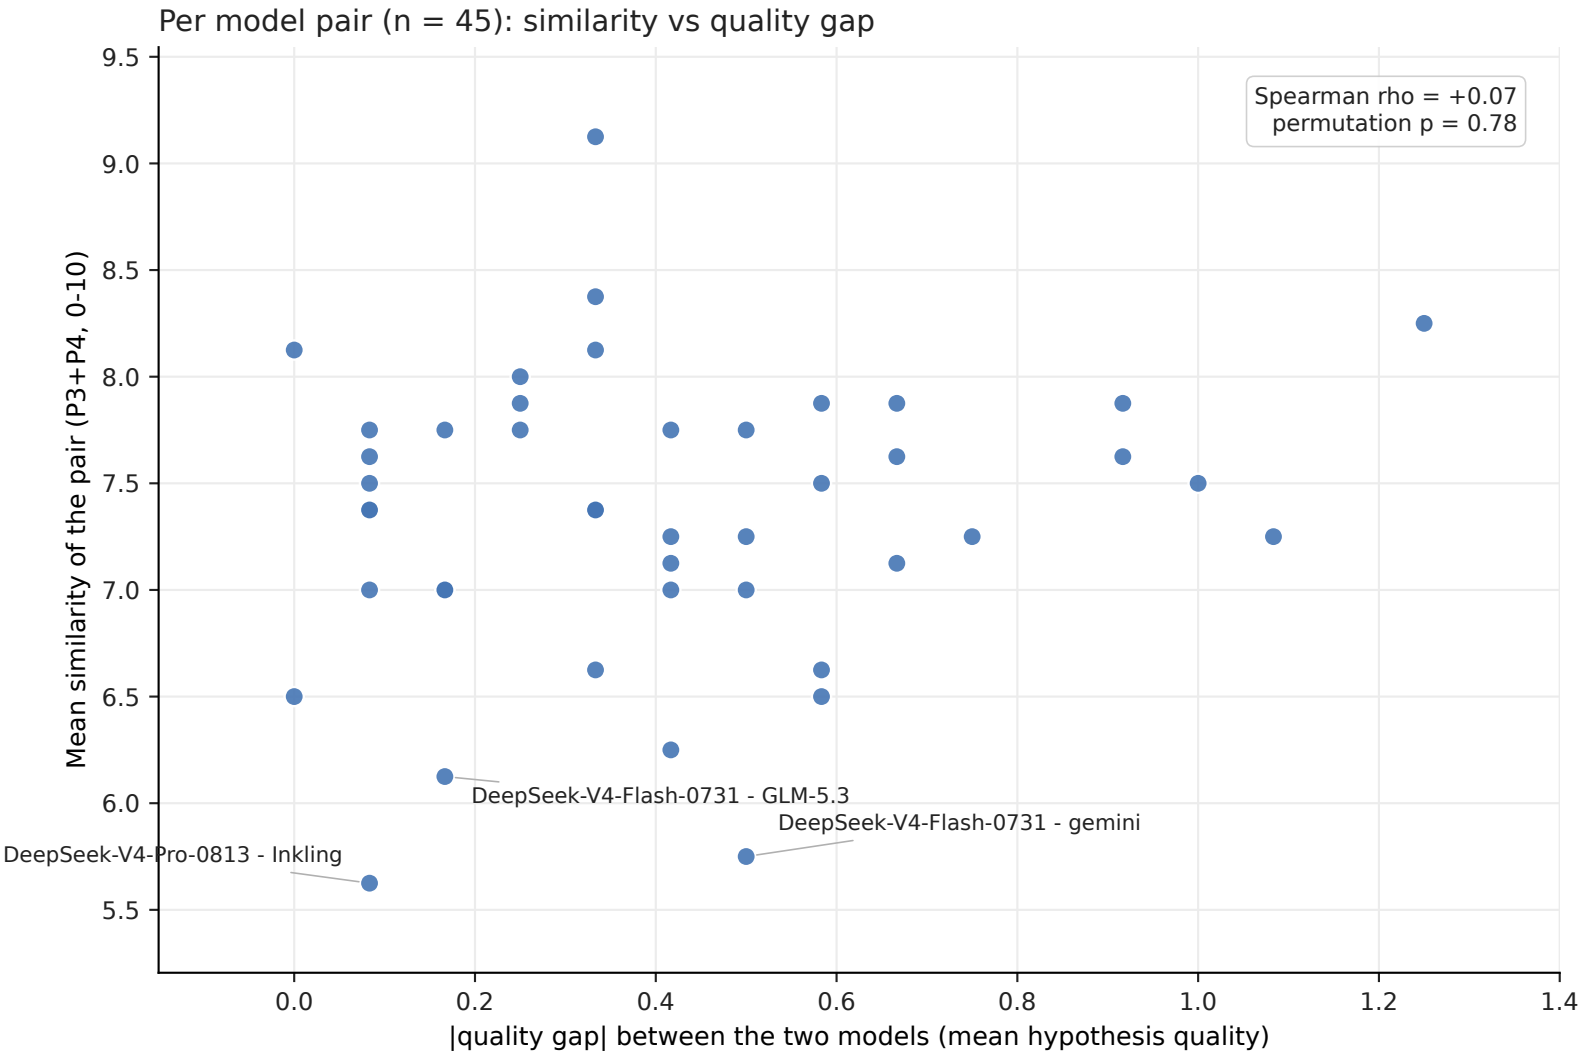
Is model-pair similarity related to the quality gap?

10 models (selected; IL2RA and pRPS6 excluded), 4 cases; similarity = P3+P4



Each dot = one pair of models. Similarity = mean P3+P4 over the cases; quality gap = |difference of the models' mean hypothesis quality| (mean of Biological Plausibility, Specificity, Mechanistic Synthesis). Spearman rho; Mantel-type permutation test (model labels permuted).
